Abstract

Background: The purpose of this study is to analyze the relationship between participatory ethical culture and evaluating the performance of knowledge employees and its outputs in knowledge-based companies in Tehran.

Method: This study was applicable in terms of purpose and research method was descriptive-correlational. The statistical population was senior managers and deputies of knowledge-based companies in Tehran. By simple random sampling method, 400 people were selected as the sample with a return rate of 388 people. The research tool was a researcher-made questionnaire. To test the research hypotheses, structural equation tests and partial least squares method have been used.

Results: The results of this study showed that there is a positive and significant relationship between evaluating the performance of knowledge staff with individual outputs and organizational outputs. Also, the moderating effect of participatory ethical culture on the relationship between performance appraisal of knowledge employees and individual outputs as well as the relationship between performance appraisal of knowledge staff and organizational outputs has been confirmed.

Conclusion: When there is a culture of participatory ethics in an organization, performance appraisal, although it increases organizational outcomes, further leads to improved individual outcomes.

Keywords: Participatory ethical culture, Performance evaluation, Individual outcome, Organizational outcome

Introduction

Knowledge employees are the strength of knowledge-based companies that cannot be imitated by competitors. Due to the movement of societies from traditional to modernization, knowledge-based companies based on the use of knowledge forces have emerged (1). A look at these changes has led employees who initially used their manual forces to rely on their ideas, knowledge and skills today (2). Performance appraisal is one of the functions of human resource management that has been mentioned in various texts such as human resource development, determining training needs, reducing mental gaps between managers and employees or creating a teamwork environment with competitive disadvantages. In all of these topics, there are a variety of goals for evaluating performance in specific research that occur under specific circumstances (3). There has been relatively comprehensive research on ethical issues in organizations. Ethics (work ethic and participatory ethics) depend on current evaluations in organizational, work, and social environments; in fact, current evaluations build the norms and beliefs of current ethics. Thus, ethics in general may be seen as a description of society.

Work ethics is considered as the distance between the ethical behavior of the company and the market perception of the ethics of the company. One of the topics in the field of work ethics is the culture of participatory ethics. Participatory ethics has an intrinsic effect on good work performance. In particular, participatory ethics is considered as the gap between the ethical behavior of management and employees' perception of the ethical behavior of the manager in work performance. There is a close relationship between work ethic and participatory ethics. Work ethic is based on the extra-organizational approach of the company's work performance and is a sub-branch of applied ethics, while corporate ethics has a completely opposite perspective and is based on the intra-organizational approach. Extra-organizational approach means that

the results of the company's ethical behavior are determined by external sources in the market such as customers, suppliers, competitors and the government (4).

Participatory ethical culture can be considered as a category of culture that while individuals participate in all stages from the beginning of decision making to implementation and evaluation of actions, how employees participate based on ethical principles such as responsibility at the individual, group, organizational and be extra-organizational. The results of using this partnership at the individual level are increasing the level of creativity and innovation, increasing job satisfaction, creating a team spirit, self-confidence and increasing motivation, developing skills and increasing the level of knowledge of individuals (5) Some researchers (6) found that employees' ethical beliefs, which are a subset of their ethical culture, have a significant effect on their in-role and extra-role performance. In this study, work ethics is a set of values and norms that employees use while working. According to what has been said, participatory ethical culture is a kind of values, assumptions and beliefs that are determined by external stakeholders and influential factors such as customers and competitors.

With the studies conducted, research in the field of performance appraisal has been done more around identifying the parameters and variables of performance appraisal, or in other words, more on how it works and the effective factors or results of using performance appraisal in research have not been studied (7). Also, research has less examined the role of participatory ethical culture in relation to performance appraisal and individual and organizational consequences. Although performance appraisal plans are formulated and implemented separately, these plans must be integrated with individual and team goals and the process of group participation and sharing of responsibilities and mutual expectations must be identified in order to achieve successful results. Due to this, the present study

was formed with the aim of analyzing the relationship between participatory ethical cultures and evaluating the performance of knowledge employees and its outputs in knowledge-based companies in Tehran. And the following four hypotheses were examined:

Hypothesis 1. Performance appraisal has a direct and significant effect on individual outcomes.

Hypothesis 2. Performance appraisal has a direct and significant effect on organizational outcomes.

Hypothesis 3. Participatory ethics culture has a moderating effect on the relationship between performance appraisal and individual outcomes.

Hypothesis 4. Participatory ethics culture has a moderating effect on the relationship between performance appraisal and organizational outcomes.

In the following, the theoretical model of the research is shown in Figure 1.

Fig. 1: Theoretical model of research

Material & Methods

This research is applied in terms of purpose and descriptive-correlation in terms of method. The statistical population of the study is human resources experts and managers of knowledge-based companies in Tehran. The number of knowledge-based companies operating in Tehran is 1525 companies and the minimum number of employees and managers of these companies is 3050 people. Some researchers (8) have stated that the number of statistical sample members that are suitable for data analysis is between 300 and 500. In this study, 400 people among managers and human resources experts of companies were selected as a sample by simple random sampling method (return rate was 388 people whose demographic characteristics are presented in Table 1). The research tool was a re-

searcher-made questionnaire. The research questionnaire consisted of two parts. The first part asked demographic questions such as gender, marital status, etc. (Table 1) and the other part included standard questions with a 5-point Likert scale. In that, the variable of evaluating the performance of knowledge employees with 31 questions, the variable of participatory ethical culture with 13 questions and the variable of consequences were measured using 16 questions. Its validity has been confirmed by using content validity and structural validity and its reliability has been confirmed by using Cronbach's alpha test and composite reliability. SPSS22 and Smart PLS software were used to analyze the data and structural equation modeling was used to test the hypotheses.

Table 1: Results of descriptive statistics of research

Variables	Range	No	Percentage
Gender	Male	244	63
	Female	144	37
Age	Under 29ys	94	24
	30-39ys	187	48
	Up to 39ys	107	28
Education	B.A. & less	252	65
	M.A	73	18
	Ph.D.	63	17
Marriage	Single	238	61
	Married	150	39
Total		388	100

Results

Questionnaire reliability and validity and structural model fit

In order to determine the reliability of the tool used, the internal compatibility test was used. One of the most widely used methods for evaluating the reliability of measurement models is to examine internal consistency. Internal consistency analysis follows the proposed method of comparing the three

compatibility indices of composite reliability, Cronbach's alpha and the mean variance extracted with a critical value. Table (2) shows the coefficients of the internal compatibility indices. All composite reliability coefficients and critical over-reliability are 0.7 and all extracted mean variance is more than 0.5. As a result, it can be said that the reliability of measurement models and convergent validity is acceptable.

Table2: Mean variance extracted and reliability of questionnaire components

Variables	Dimension	Composite reliability	Cronbach's alpha	Average variance extracted
Evaluate employee performance	Knowledge and experience	0/763	0/778	0/774
	responsibility	0/811	0/808	0/703
	Honesty	0/750	0/763	0/759
	Individual courage and bravery	0/743	0/753	0/719
	Commitment and intimacy	0/729	0/738	0/738
	Individual confidence	0/735	0/741	0/729
	connections	0/739	0/733	0/741
	flexibility	0/741	0/762	0/727
	Discipline	0/744	0/749	0/738
	Respect	0/751	0/769	0/789
	creativity and innovation	0/768	0/774	0/812
Participatory ethical culture		0/823	0/841	0/843
Consequences	Individual	0/763	0/771	0/728
	Organizational	0/758	0/802	0/709

After collecting information, in order to determine to what extent each measurement index (items) is acceptable for measuring and evaluating hidden variables, it is first necessary to evaluate them using

confirmatory factor analysis. The results of confirmatory factor analysis presented in table 3 show that all questions for measuring hidden variables are at a desirable level and can measure and evaluate hidden variables well.

Correlation analysis of research variables

Pearson correlation coefficient measures the degree of linear correlation between two random variables. The value of this coefficient varies from 1 to -1, with "1" meaning complete positive correlation, "0" meaning no correlation, and "-1" meaning complete negative correlation. As the results in table (4) show. There is a positive and significant relationship between all research variables.

Table4: Pearson correlation coefficient to investigate the relationship between research variables

	1	2	3	4
Participatory ethical culture	1			
Individual consequences	0/678	1		

Organizational consequences	0/709	0/714	1	
Evaluation of performance	0/769	0/748	0/692	1

Structural Equation Modeling (Research Structural Model)

One type of relationship between latent variables in a structural equation model is the direct effect type. The structural model examines the relationships between exogenous and endogenous secretions. In the following model, the performance evaluation variable is an exogenous and independent latent variable. The variable of participatory ethical culture is the endogenous and moderating variable and the variable of individual and organizational consequences is the latent endogenous and dependent variable.

Fig. 2: Investigation of the model in the significant case of T-VALUE number without modulator effect

Fig.3: Investigation of the model in the path coefficient mode without the moderator effect

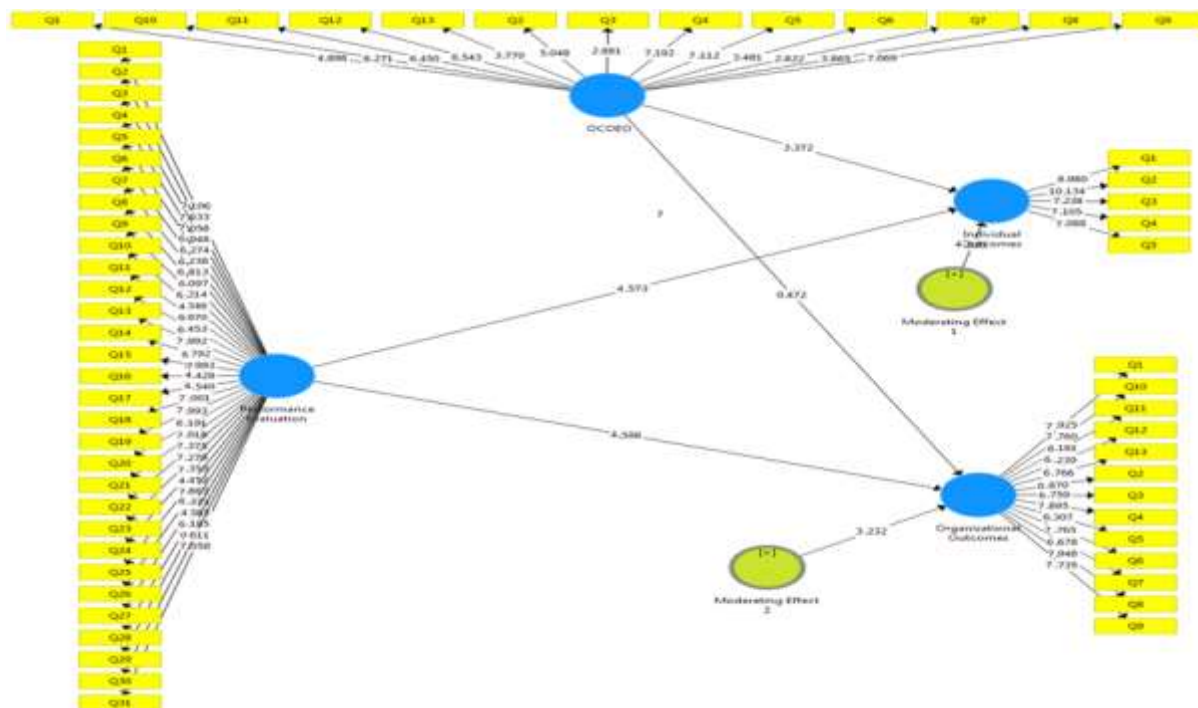

Fig.4: Investigation of the model in the significant case of T-VALUE number with the moderating effect of participatory ethical culture

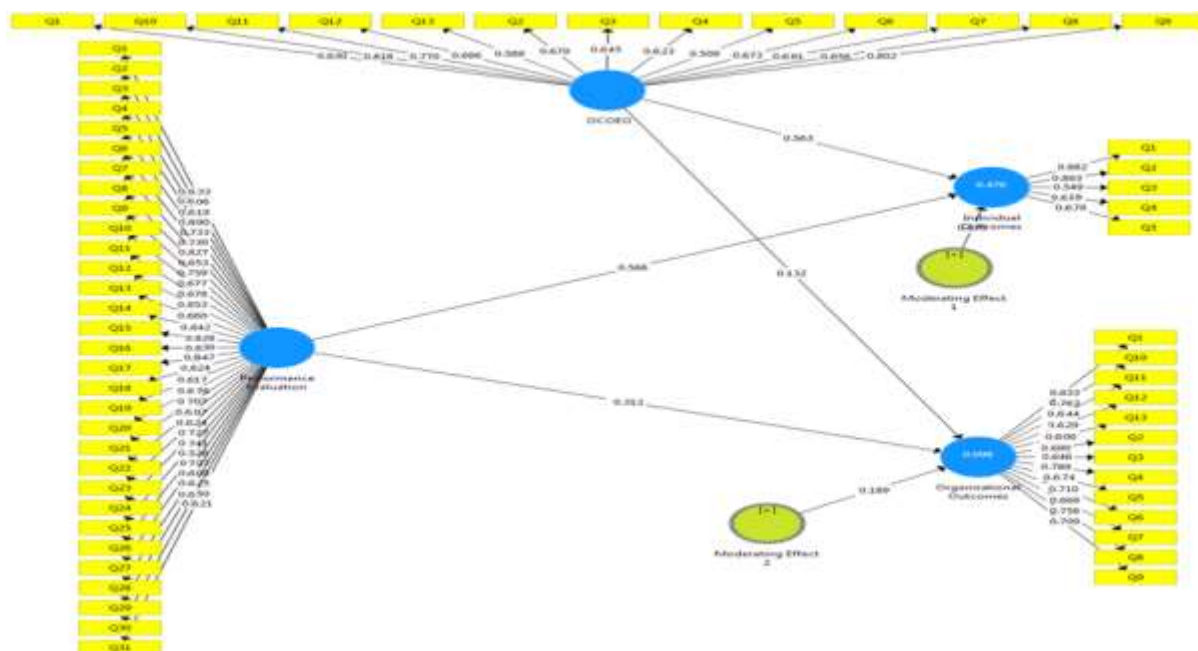

Fig. 5: Investigation of the model in the path coefficient mode with the moderating effect of the variable of participatory ethical culture

In the table 6, the statistical results of the hypotheses are presented.

Table 6: Path coefficients and t values for the relationships between variables

From	to	Standard coefficient	t value	Result
Evaluation of performance	Individual consequences	0/469	4/995	Accepted
Evaluation of performance	Organizational consequences	0/637	8/529	Accepted
Mediator	Relationship	Standard coefficient	t value	Result
participatory ethical culture	Evaluation of performance & Individual consequences	0/195	4/833	Accepted
participatory ethical culture	Evaluation of performance & Organizational consequences	0/189	3/232	accepted

Discussion

The purpose of this study is to obtain the consequences of using the performance appraisal system at the individual and organizational levels and also to investigate the effect of participatory ethical culture in these relationships. In the statistical analysis section, it was found that there is a direct and significant relationship between performance evaluation and individual and organizational outcomes. The path coefficient at the level of organizational outcomes is higher than the path of individual outcomes, which indicates a greater and more significant effect of performance appraisal on organizational outcomes. This result is consistent with the results of some studies (9-11). However, with the introduction of the moderator variable of participatory ethical culture, the effect of performance appraisal on individual outcomes has increased. The results obtained in this study are consistent with previous research (12-17). Researchers have also found that the performance appraisal system is not very effective regardless of organizational conditions and culture, and despite the participatory culture that is based on ethical principles, we can expect better individual and organizational outcomes. Interested researchers are encouraged to test the model in other organizations and companies and use semi-structured interviews to find a native performance appraisal model for the case under study..

Conclusion

The culture of any organization is directly related to the common traditions, beliefs and expectations of individuals, and in general, culture can be considered a set of beliefs, feelings, symbols, behaviors and characteristics that make up an organization. Different experts have divided organizational culture into different categories and patterns. Among them, the concept of participatory ethical culture is seen as an important model in work ethic. When there is a culture of participatory ethics in an organization, performance appraisal as a process of identifying, observing and improving human performance in organizations, although it increases organizational outcomes, further leads to improved individual outcomes as employees evaluate performance. They do not see negative judgment from their superiors, and they are more likely to understand that the purpose of performance appraisal is to increase one's self-satisfaction and commitment.

Ethical Consideration

Ethical issues (including plagiarism, informed consent, misconduct, data fabrication and/or falsification, double publication and/or submission, redundancy, etc.) have been completely observed by the authors.
