World Academy of Sciences, Trieste, Italy

The English word **"ethics"** is derived from the ancient Greek word **ēthikós** (ἠθικὸς), meaning "relating to one's character", which itself comes from the root word **êthos** (ἦθος) meaning "character, moral, nature".(1). This was borrowed into Latin as ethica and then into French as éthique, from which it was borrowed into English.

The Cambridge Dictionary of Philosophy states that the word **"ethics"** is "commonly used interchangeably with **'morality'** ... and sometimes it is used more narrowly to mean the moral principles of a particular tradition, group or individual (2).

Ethics has an old historical background, as it is an important and applicable content and it plays an important role in social life of human being (3). According to the known history and human culture, it can be said that **Zoroaster** is the first who spoke about ethics and he advised on "**good words**, **good thoughts** and **good deeds**". The core of his speeches and thoughts was ethics. The role of **Zoroaster** in philosophical ethics was highlighted and followers of **Plato** compare him with Zoroaster. **Nietzsche** said that Zoroaster is the creator of ethics (4).

One of the most important documents related to codes of ethics was the statement of **Cyrus the Great** (538 BC). This statement includes the following features: freedom, respect for human right, respect for all religious and cultures and safe-guarding human dignity. It can be **"the base of human rights in the world"** (4)

Greek philosophers had a clear role in developing ethics. **Socrates**, **Plato** and **Aristotle** were the teachers of ethics. The first book that was written in ethics was the **Nicomachean ethics** by Aristotle. In this book, Aristotle named human as a social animal that needs social communication with others. The most important part of this communication is "**ethics**" (5).

The German Philosopher, **Kant** (1724-1809) determined that the root of wisdom is in ethical action. He believed that ethics is an instruction that agreed with each wise man. Therefore, if a human being is ethical, it is equally wise and free, and the freedom of society depends on the existence of moral and rational people(6).

Literature available from scientists and philosophers on ethics can be the witness for importance of ethics in human society. How is the society without ethics?

Ignoring ethics has deadly effects on the body of society and the following effects can be pointed out:

* **Corresponding Author:** Email: akhlagh_drfarhood@yahoo.com

- First: Immorality prevalence reduces the level of happiness and life satisfaction in society. When individuals act to profit more immoral, they do not take into account the interests of others, who may be harmed by the immoral conduct. In this way, the interests of the majority are sacrificed for the benefit of the minority, and by creating a sense of dissatisfaction and failure in the majority, the society moves toward depression, anxiety and recession. The idea that ethics and happiness are related is not new. The fact that ethical behavior leads to increase of happiness, life satisfaction and, in general, the victimization of individuals is discussed by scientists and philosophers. There are sufficient evidence showing that happiness leads to ethical behaviors and it influences on all thoughts and judgments (7).
- Second: Breach of morality affects the level of trust among individuals. Trust is an important factor that affects all social relationships. Doubts and distrust among people can put society's economy at a serious challenge (8).
- Third: Ignoring law and the prevalence of lawlessness can be a negative consequence of ignoring morality. Ignoring law, explicit and implicit, endanger the health of society. It slows the development of society by influencing on social capital and it challenges achieving sustainable development (9).

Because of the importance of ethics in society a major in ethics is formed in human sciences. It concentrates on features of values and acquiring values and leaving unethical behaviors. It can be said that ethics is the science for considering values on human behaviors.

The position of science in respect to ethics is important and clear. Scientists and researchers of different domains pay more attention to ethics from different aspects. They aim is to develop ethics in society. In the following table, different branches of ethics are classified and presented (4).
